A blurred photograph of a hospital hallway. In the foreground, a man in blue scrubs and a woman in a grey nurse's uniform are walking towards the camera. The hallway is long, with a shiny floor reflecting the overhead lights. On the right side, there are glass doors and a metal handrail. The text "Concussion and Traumatic Brain Injury in Pediatric Patients" is overlaid in a large, bold, dark blue font on the left side of the image.

Concussion and Traumatic Brain Injury in Pediatric Patients

The problem

Increase in the number of pediatric patients with mild traumatic brain injury (mTBI)

Healthcare providers don't have the time or training to appropriately assess patients with mTBI

How can we improve evidence-based diagnosis and management of mTBI in children?

The Solution

- 1) To develop a provider interface that provides clinical decision support mTBI in children
- 2) To develop a parent/patient app that alerts parents about symptom monitoring and follow-up, and aids in communication between parents and the healthcare and school settings.

The plan

An evolutionary prototyping software development process is proposed. This will require a larger time commitment from the subject matter experts (SMEs), thus this is subject to change pending their availability.

Step 1

Gather initial requirements and design a prototype

Step 2

Develop an initial prototype and perform workshop with SMEs

Step 3

Gather more requirements based on workshop, repeat steps 1 and 2 until all requirements met

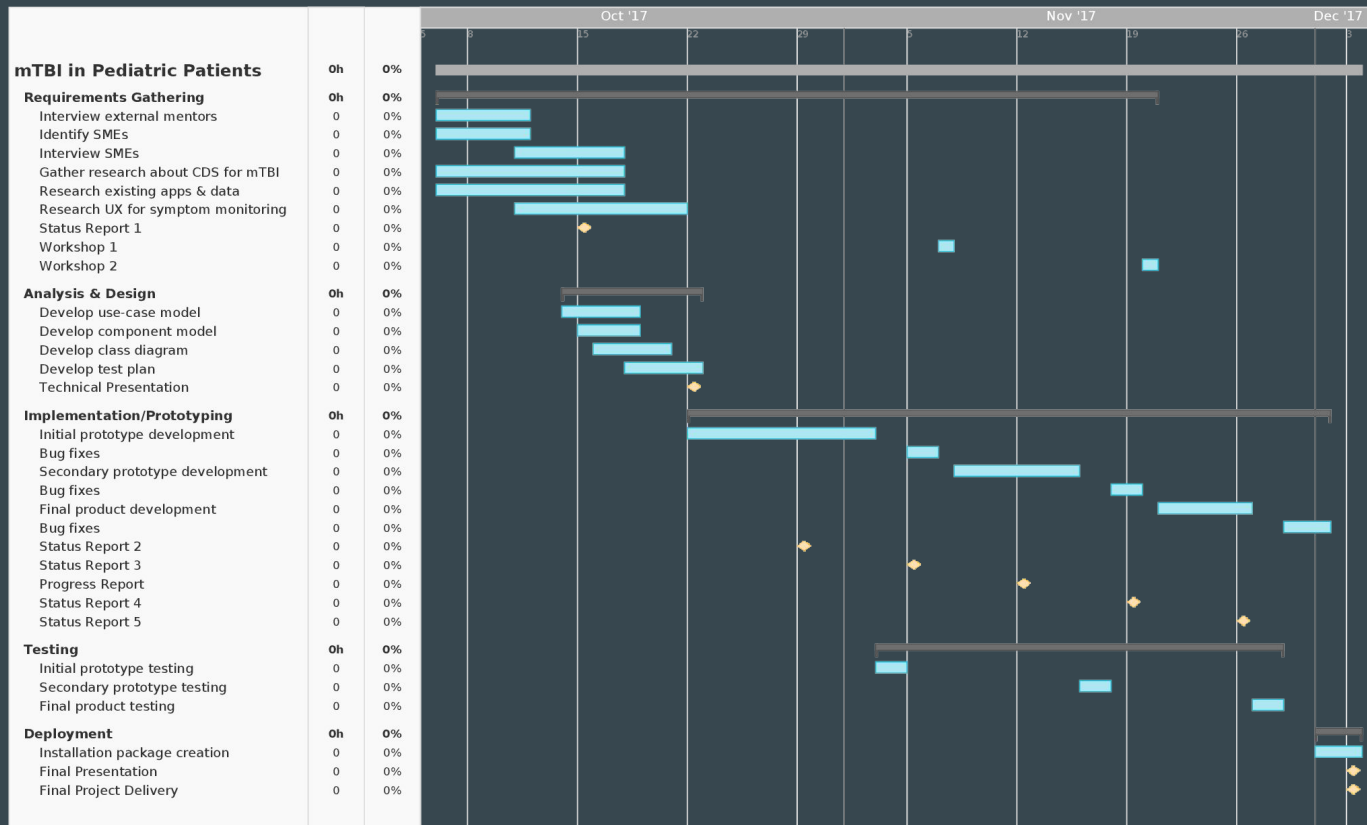

Research

The requirements gathering phase will require extensive research:

- Survey of existing apps and data in the TBI domain to get a head-start
- Subject matter experts in diagnosis and management of mTBI will be interviewed to build a knowledge-base for the CDS
- Gathering of user experience design guidelines for patient/parent-facing symptom monitoring apps

Schedule

Thank You!

Thank you for your attention.

We look forward to working with Kelly and Juliet on this project and hope that it will meet all expectations.
